| <p>Solvent composition is formed by mixing a petroleum-based dry<br/> cleaning solvent (50-90 vol.%) with at least one dibasic acid dialkyl<br/> ester of formula R-O-CO(CH<sub>2</sub>)<sub>n</sub>CO-O-R (I) (10-50 vol. %). R = 1-4C<br/> alkyl and n = 2-4.</p> <p><u>USE</u><br/> The solvent composition is used for dry cleaning.</p> <p><u>ADVANTAGE</u><br/> The composition has improved cleaning for oil soluble stains,<br/> particularly for cotton, and has good cleaning for water-soluble stains<br/> compared to soap-added petroleum-based dry cleaning solvents, and<br/> resoiling to white cloth equal to that given by soap-added petroleum-<br/> based dry cleaning solvents, and improved resoiling compared to<br/> soapless petroleum-based dry cleaning solvents. The composition has<br/> volume resistivity lower than that given by petroleum-based dry</p> | <p>cleaning solvents, reduced static electricity in cleaning and drying<br/> processes when the soap concentration has slightly low variation. Risk<br/> of fire or explosion is reduced.<br/> (13ppDwgNo.0/0)</p> <p>JP 09143497-A</p> |
